Grain and Feed Update

Revised production and trade forecasts for MY2018/19 and MY2017/18

Approved By:

Dwight Wilder, Agricultural Attaché

Prepared By:

Denys Sobolev, Agricultural Specialist

Report Highlights:

This report contains revised production and trade forecasts for MY2018/19 as well as updated trade and consumption estimates for MY2017/18.

Production

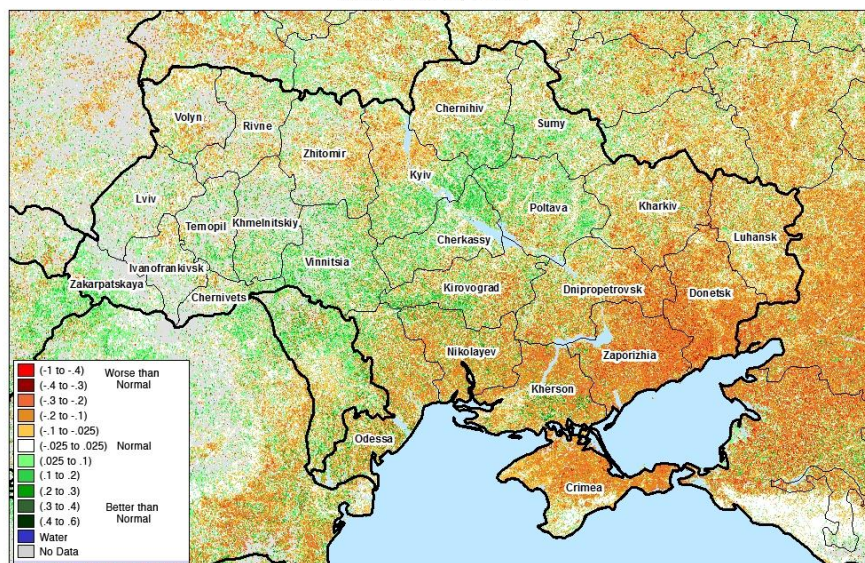

For a more comprehensive outlook of the Ukrainian grain market please refer to our [Annual Grain Report](#). This report focuses on forecasted changes in production of major grain crops for MY2018/19 as well as updated trade and consumption estimates for MY2017/18.

At the time of this report publication Ukrainian farmers have begun harvesting wheat and barley. In general, the harvesting deadlines this year shifted two weeks earlier compared to 2017, due to weather anomalies. This was spurred by rapid increase of temperatures in spring 2018, resulting in both fast plant growth as well as rapid depletion of topsoil moisture. This led to lower-than-expected areas under spring wheat, barley, and spring rye areas in 2018. According to industry sources, some batches of wheat and barley will likely be substandard quality due to intensive rains that took place in late June – early July, which created a favorable environment for pests and mycotoxins.

As of June 5, 2018, the Ministry of Agricultural Policy and Food of Ukraine (MAPF) reported preliminary spring planting areas as follows: wheat – around 170 thousand hectares (ha), a 3-percent decrease compared to 2017; barley – around 1,510 thousand ha, a 4-percent decrease; and corn – around 4,570 thousand ha, a 2-percent increase. FAS-Kyiv uses these numbers in combination with reported winter planted areas as the baseline for estimating grain production for MY2018/19.

The satellite imagery below depicts the vegetative development index (NDVI) as of the second half of June 2018. It confirms reports by the farming community suggesting significantly deteriorated plant growth conditions in Southern (steppe) regions compared to the same period of 2017.

**Ukraine: MODIS NDVI Anomaly Departure from Average

IPA Division

FAS-Kyiv uses this as justification to decrease 2018 yield forecasts for grains, compared to 2017, assuming no significant changes in weather conditions in July-August. Corn yields could be increased in case of sufficient precipitation volumes late this summer.

Trade

Statistical information covering trade is included in the Author Defined section at the end of this report. MY2017/18 exports of all grains are in-line with typical annual patterns and correlate with production volumes of individual crops in 2017. This provides justification for relatively unchanged domestic consumption patterns for major grains.

In terms of trade, wheat flour and products are the most dynamic. Exports have increased by 17 percent during July 2017-April 2018, compared to the previous period. The major growth drivers were exports to East and Southeast Asia (predominantly China) – a 47-percent increase; EU – a 2-fold increase; and Africa – a 7-percent increase. Supplies to the Middle East remained virtually unchanged.

Imports of wheat flour and products have also increased by 51 percent during July 2017-April 2018 compared to the previous period. The major growth factors were imports from the EU (major trading partner) – around 22-percent increase, and Turkey – a 47-percent increase. There was also a boost in imports from neighboring Belarus – reaching 4.7 thousand MT, compared to 237 MT for the previous period. These numbers indicate signs of economic recovery and increased consumer spending as Ukraine usually imports high-quality durum wheat flour and pasta. Post believes that Ukrainian consumers will continue to buy these imported goods in 2019 assuming a stable macroeconomic

situation in the country.

The MAPF has published ([in Ukrainian](#)) the preliminary export numbers for grains from July 2017 till June 2018: wheat – 17,139 thousand MT; barley – 4,289 thousand MT; rye – 36.8 thousand MT; corn – 17,739 thousand MT; and wheat flour – 412.6 thousand MT. These numbers (except for corn as the local MY does not correspond to USDA’s MY) are included in PSDs as relevant export estimates for MY2017/18.

Consumption

In line with available MAPF trade data, FAS-Kyiv decreased MY2017/18 feed consumption for wheat compared to initial estimates, and compensated for the decrease with increased barley feed consumption. This was done in order to maintain estimated feed consumption for all grains, which was mentioned in the General Outlook section of our [Annual Grain Report](#).

Production, Supply and Distribution Data Statistics

Estimated wheat flour, pasta, and bakery exports/imports have been added to trade volumes for wheat, in wheat grain equivalent, calculated by multiplying the product weight by 1.368.

Grain production numbers include production numbers for the Crimean Peninsula.

Barley:

Post’s production estimate for barley is around 8 percent higher than USDA’s official data for MY2018/19, based on rationale discussed in the Production section.

Post’s import estimate is 40 percent lower than USDA’s official data for MY2018/19, based on relatively stable areas under this crop translating into stable seed imports.

Post’s export estimates are around 5 percent lower than USDA’s official data for MY2017/18, based on available export data by MAPF; and over 8 percent lower for MY2018/19, based on production and consumption estimates by Post.

Post’s Feed and Residual estimates are 23 percent higher than USDA’s official data for MY2017/18; and 30 percent higher for MY2018/19, based on estimated export volumes as well as arguments included in the Consumption section.

Corn:

Post’s production estimate is around 18 percent lower than USDA’s official data for MY2018/19, based on yield estimates discussed in the Production section.

Post’s import estimates are 60 percent higher than USDA’s official data for MY2017/18, based on available trade data; and 20 percent higher for MY2018/19, based on the assumption that 2019 corn

areas remain within the five-year average level.

Post's export estimates are around 10 percent lower than USDA's official data for MY2017/18, based on available trade data; and over 29 percent lower for MY2018/19, based on production and consumption estimates by Post.

Post's Feed and Residual estimates for corn are around 8 percent higher than USDA's official data for MY2016/17; 60 percent higher for MY2017/18; and 31 percent higher for 2018/19, as this crop remains one of the most affordable feeds in Ukraine (for more information about grain prices please refer to the General Outlook section of our [Annual Grain Report](#)).

Rye:

Post's export estimates are 3.7-fold higher than USDA's official data for MY2017/18, based on available export data by MAPF; and 5-fold higher for MY2018/19, based on production and consumption estimates by Post.

Post's Feed and Residual estimates are 80 percent lower than USDA's official data for MY2016/17, MY2017/18, as well as MY2018/19, based on low level availability of this crop on the market.

Post's FSI estimates are 8 percent higher than USDA's official data for MY2016/17; 18 percent lower for MY2017/18; and 2 percent higher for MY2018/19, based on stable consumption patterns for this crop.

Wheat:

Post's production estimate is around 3 percent lower than USDA's official data for MY2018/19, based on decreased yield estimates discussed in the Production section.

Post's import estimates are around 10 percent lower than USDA's official data for MY2016/17; and 2 percent higher for MY2017/18, based on available trade data. Post's import estimates are 2-fold higher than USDA's official data for MY2018/19, based on assumptions mentioned in the Trade section of this report.

Post's export estimates are around 3 percent higher than USDA's official data for MY2017/18, based on available export data by MAPF; and over 10 percent lower for MY2018/19, based on production and consumption estimates by Post.

Post's Feed and Residual estimates are 8 percent higher than USDA's official data for 2016/17; around 3 percent lower for MY2017/18; and over 20 percent higher for MY2018/19, based on estimated export volumes as well as arguments included in the Consumption section.

Post's FSI estimate is 3 percent higher than USDA's official data for 2018/19, based on a gradual decrease of population, as well as increasing growth of imported products discussed in the Trade section of this report.
